

Relativity® 6

OVERVIEW

Relativity Six is the faster, more scalable e-discovery review platform that gives you easy, flexible ways to understand and take action on your case data.

RELATIVITY PIVOT

Relativity Pivot introduces completely new analysis functionality to Relativity that can be leveraged from the earliest stages of a case to the latter stages of issue review and deposition preparation. Users can summarize all data in a case, displaying the results in a variety of ways, including clickable tables and charts. The results are interactive, allowing users to drill into subsets of documents and take action, such as culling irrelevant documents, batching documents for review, and exporting a report of user findings.

Relativity Pivot can help attorneys tell the story of a case through e-mail domain analysis, as well as by making visual such information as e-mail frequency, keyword hits by custodian, timelines, and file type distribution. Additionally, Pivot can be used to monitor the quality and progress of the review.

PERFORMANCE AND WORKFLOW

Relativity Six includes significant performance increases to data import, data export, productions, and searching. These increases were enabled by upgrading the application framework and overhauling the dtSearch integration.

The Relativity user interface has been updated with a focus on users and their data. Attorneys and reviewers will benefit from improved usability and minimal training requirements. Litigation support professionals and project managers will realize time savings and better workflows for completing administrative tasks and managing cases.

In addition to user interface updates, a number of features such as auto batch creation, combined searches, and customizable skip rules have been added to improve, accelerate, and further automate workflow throughout the platform.

WHAT'S IN A RELEASE?

Relativity Six introduces hundreds of refinements to improve the usability and increase the overall functionality of Relativity. The goals of the release were to enhance the performance and workflow associated with Relativity's core review capabilities; respond to our users' requests for better methods of analyzing their data; improve the usability of our concept search and clustering features; and continue to provide more ways for our clients to customize the platform.

"We've pushed ourselves with Relativity Six to provide something inspired, while staying true to the core application and our ideals with respect to delivering software."

RELATIVITY ANALYTICS

Relativity Six supports the goal of making advanced search features, such as clustering and concept search, easy to use and accessible to end-users on cases of any size. Notable enhancements include improved titling for document clusters, as well as the automation of similar document groups as a part of standard index creation. Document compare has been re-architected, giving users an indication of the differences between conceptually related documents.

EXTENSIBILITY

A published web Application Programming Interface (API) provides integration points that allow greater flexibility to customize Relativity or integrate with other core e-discovery applications. An import-specific API creates the ability to import processed data from an SQL source, allowing users to move data directly into Relativity without the need to manually export and import load files, thus reducing the risk of human error and expediting the availability of documents for attorney review.

A data transformation engine provides yet another extensibility point in Relativity Six, allowing for metadata or full text fields to be searched and manipulated via regular expressions, populating the results in a new field. This functionality benefits Relativity Six users by providing e-mail domain analysis, but it also can be customized to provide a wide variety of case-specific solutions.

COLLABORATION

With a continued focus on providing responsive and innovative customer service, Relativity Six will introduce a single sign-on to the Relativity Customer Portal from within Relativity. The Relativity Customer Portal is a centralized, web-based resource for contacting Relativity support; viewing lists and reports of current and historical support tickets; submitting ideas and feature requests to the Relativity engineering team; viewing self-paced Relativity tutorials; and accessing all technical and end-user documentation through automated subscriptions.
